

Supplemental Note C

Supplementary material for

ECDSA.Fail: Open Autoresearch for Optimizing Elliptic-Curve Point Addition in Shor's Algorithm

The paper cites this document as Supplemental Note C. Section, figure, and table numbers continue those of the main paper, so a reference such as Section 5.3.1 or Table 2 carries the same number here as it does there. References to material outside this note resolve in the main paper or in a sibling Supplemental Note.

C Optimization Census of Accepted Competition Source Commits

This note lists every accepted source commit of the public competition (Supplemental Note B), assigned to its primary transformation family or residual bucket—the same census summarized in Figure 10, here expanded to one row per commit. Official operating points—*Score* = average executed Toffoli $\times$ peak qubits (lower is better) and Δ , the score change versus the prior public frontier—are joined from the ecdsafail leaderboard; they are not in the git history itself. Of the 404 accepted “Accept submission” commits through 18 July, 400 have leaderboard score records: 397 match the **promoted** rows in the 2 July ledger snapshot against which this census was reconciled, and three are later scored commits. The remaining four are the contest’s **DUMMY_TOFFOLIS** bootstrap commits, which went through the acceptance plumbing but were never scored and are marked (*unscored*). Accepted source commits and current ledger-status rows are therefore related archival views, not interchangeable counting units. Each row’s assignment is made by an audit of its actual `git show diff` (not its commit subject or lever name, which are frequently unreliable), matching Figure 10. Rows are grouped by family in descending order of frequency—with the two residual buckets (verifier search, neutral) and the unscored bootstrap group placed last—then by change-type (level 2 of Figure 10), and within a change-type by score (best first).

The largest recorded frontier delta belongs to the two-jump inversion base (cddd5df, under Windowing), whose Δ is nearly one billion; it is the landed **DIALOG_GCD** reimplementation of the modular inverse. This ledger lists all 404 accepted commits, including the four unscored bootstrap rows—placed in their own *Unscored bootstrap* group—that Figure 10 excludes; on the 400 scored source commits the ledger and the figure agree family by family.

Table 8: Competition optimization census: all 404 accepted source commits (#883–1294) through 18 July, classified by primary family, with official leaderboard score and frontier delta where available. 400 scored; 4 unscored bootstrap commits.
